# Appendix D Some Characterizations of Odd and Even Edges in the nD-OPP's 

Property D.1: In 1D space an odd edge is equivalent to a manifold edge (1D-OPP's are segments and themselves are odd edges).

Property D.2: In 2D space an odd edge is equivalent to a manifold edge. In this space an even number of incident rectangles defines a non-valid edge (an edge not included in the final 2D-OPP described by the rectangles).

Property D.3: In 3D space an odd edge is equivalent to a manifold edge. In this space an even number of incident boxes defines a non-manifold edge or a non-valid edge (an edge not included in the final 3D-OPP described by the boxes).

Property D.4: In 4D space an odd edge is equivalent to an extreme edge. Moreover, the following characterizations, of odd/extreme edges in the 4D-OPP's, are identified in terms of the boundary elements (the possible 65,536 combinations of 4D hyper-boxes were exhaustively verified):

| Incident <br> 4D Hyper-boxes | Number of incident 3D volumes not <br> included in volume adjacency |
| :---: | :---: |

| 3 | 5 |
| 3 | 7 |
| 3 | 9 |
| 5 | 5 |
| 5 | 7 |
| 5 | 9 |
| 7 | 3 |

Property D.5: In the 4D-OPP's we have identified the following characterizations for odd edges (the possible 65,536 combinations of 4D hyper-boxes were exhaustively verified):

|  |  |  | Distribution of the incident 3D volume (not included in volume adjacency) in the three hyperplanes where the odd edge is embedded. |  |  |
